Firmware Release Notes

v26.05 Released June 24, 2026

Our first system update for the OV1 is here! Thank you to the handful of very first owners of the overlay unit for quickly bringing forward a small collection of overlooked UI quirks and ideas for useful features. These have been implemented and are outlined in detail below.

As a friendly reminder, please make sure to update all three components (Base, Handset, OV1) with the OV1 requiring two updates: .hex with the Focusbug Programmer, and .ov1 with the provided USB Drive. See below for more details on the update process.

Stay tuned for beta features in upcoming releases. The OV1 continues to improve, and we would love your feedback on its direction.

NEW

- Presets will now persist across updates
- Button to address a RIA-1/LCube unit incompatibility has been added to the “Ring Setup” page
- System widget now includes firmware information for all connected Focusbug devices and will clearly display incompatible versions

IMPROVED

- Boot time has been improved by 20%
- Default LED brightness has been decreased
- The update process now shows an “Updating...” popup as soon as an update begins
- Custom witness mark colour is now applied to the full line in line mode
- Heden icon has been added to optional LCS icons
- A warning will now appear if the device reboots due to an unstable power source
- SDI display timing has been improved

FIXED

- Mark lines and witness mark now show in “Line Center” line mode layout
- SRC1 mark will now draw on top of SRC2 mark
- “Line Fill” option now saves correctly to presets
- Line mode can now be moved to edge of screen while opacity is not 100%
- Stability of the “B” RF Channel has been fixed
- General bug fixes to address a few reported crash scenarios
